The number of damages caused by biogenic sulfuric acid corrosion (BSA) is increasing. The development of materials resistant to BSA requires testing methods that allow for a testing of the materials that is both oriented towards practice and accelerated. To achieve this, test rigs were setup at Fraunhofer UMSICHT.

In cooperation with Dr. Brill + Partner GmbH – Institut für Hygiene und Mikrobiologie weathering tests are carried out to assess the BSA resistance of materials. The results provide indications for a targeted optimization and further development of the materials.

Keywords

- BSA
- Damage to material
- Material testing
- Microorganisms

Our services

- Conducting weathering tests
- Use of different materials and substrates
- Use of different micro organisms
- Accompanying microbial analytics
- Material optimization

Development of biogenic sulfuric acid corrosion in the sewer system*

*according to: Bock, E.; Sand, W.; Pohl, A.; Bedeutung der Mikroorganismen bei der Korrosion von Abwasserkanälen (Importance of Micro-Organisms for the Corrosion of Drainage Channels), TIS Tiefbau – Ingenieurbau – Straßenwesen, Sonderdruck zum 4. Statusseminar »Bauforschung und -technik« (TIS Magazine for Civil Engineering & Road Construction, special print for the 4th Status Seminar "Building Material Research and Technology"), 1983, pg. 47 – 49.
